

2-DAY ONSITE HANDS-ON COURSE:

TMJ and AI 3D Printing from the Occlusal Guard to the Orthotic Appliances

About the Event

3D printing is the new disruptive industry in manufacturing and will revolutionize the way we will practice digital dentistry in the near future.

This course is an introduction to understanding all aspects of the 3D printing process in the dental clinic related to the TMJ. Learn how to diagnose the different conditions that affect the TMJ and how to treat them with this new technology. From the MRI images for disk disorders to the CBCT images of the osseous tissue of the joint, different paths of treatment need to be addressed. We will teach you how to recognize the condition and how to 3D print the appliance that will help the patient.

The treatment planning phase for the different disorders and digital file design as well as an overview of available design software will be thoroughly covered.
